Pilot Emissions Data Readiness Report

KACH CANADA LTD.

Reporting period: 2026-01-01 to 2026-12-31

Report scope: Date Range

Generated date: 2026-08-14

Prepared by: CarbonLite

Prepared for review as part of a pilot emissions data readiness and reporting workflow.

Executive Summary

Detailed source, version, confidence level, and assumptions are provided in the Factor Details / Assumptions section below.

Calculation Traceability

Calculation traceability is provided for manually entered activity data and configured conversion factors. CarbonLite applies factor-level metadata and does not provide sub-reporting, and reporting year.

Hotspot analysis only includes records that were successfully calculated. Records requiring review, tracked-only metrics, missing records without valid factors, units, quantities, dates, or required jurisdiction are excluded from emissions totals and listed as factors, invalid units, or missing jurisdiction are excluded from hotspot totals and listed separately.

Source documents, source references, and factor metadata should be reviewed before using report outputs for internal, consultant, or external reporting workflows.

Top Emissions Hotspot: Natural Gas

Natural Gas contributes 100% of calculated emissions. Focus first on this category because it represents the largest share of calculated emissions.

This report was generated using CarbonLite Pilot Demo v0.1 for emissions data readiness and workflow review purposes only. It is not a certified GHG emissions report and does not constitute regulatory compliance advice, third-party verification, audit assurance, or carbon credit eligibility determination. Emission factors, assumptions, and calculations should be reviewed by qualified sustainability professionals before formal use.

Top Emission Categories

Natural Gas		100%	1,890 kgCO2e
-------------	-------------	------	--------------

Appendix: Record-Level Source Evidence

Detailed record-level source evidence retained for traceability review. The main report body summarizes this information by source file.
