CarbonLite Technical Review Package

KACH CANADA LTD.

Report Information

Prepared for review as part of a pilot emissions data readiness and reporting workflow. This draft export is not approved, verified, certified, or assured.

Reporting Boundary

Detailed source, version, confidence level, and assumptions are provided in the Factor Details / Assumptions section below.

Calculation Quality Summary

[illegible] Requiring Review

Tracked Metrics [illegible] calculated GHG emissions total by design. 1 imported activity record requires review

[illegible] Threshold Reference

Unresolved source rows have not been imported into ActivityData and are not counted as imported activity records requiring review.

Methodology and Limitations

Calculation Traceability

[illegible] import methods used to create the activity records included in this pilot report. Detailed [illegible]

[illegible] categories contributing the largest share of current estimated emissions. Hotspot analysis helps identify where the organization may want to focus first for factor validation, data quality improvement, and, where estimates are confirmed, reduction planning.

Regulatory threshold screening is not yet configured with reviewed source provenance for this jurisdiction.

Reviewed regulatory source provenance is required before threshold screening.

Threshold screening only. This does not constitute regulatory compliance advice.

[illegible] the six-stage workflow: Define Reporting Boundary; Collect & Upload Source Data; Review & Resolve Data Issues; Validate Factors & Calculations; Review Results; Generate & Review Report.

Hotspot analysis only includes records that were successfully calculated. Records requiring review, tracked-only metrics, missing factors, invalid units, or missing jurisdiction are excluded from hotspot totals and listed separately.

Emissions are calculated from imported or manually entered activity data and configured emission factors. CarbonLite applies factor matching based on activity type, unit, jurisdiction, and reporting year.

Top Emissions Hotspot: Electricity

Electricity contributes 71.70% of calculated emissions. Consider this category for reduction planning because it represents a large share of calculated emissions.

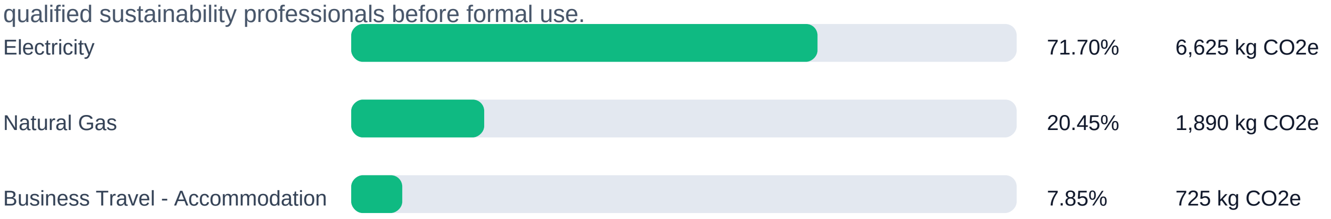
Records without valid factors, units, quantities, dates, or required jurisdiction are excluded from emissions totals and listed as records requiring review. Tracked metrics are not included in calculated emissions totals.

Source documents, source references, and factor metadata should be reviewed before using report outputs for internal, consultant, or external reporting workflows.

Electricity and Natural Gas together represent 92.15% of calculated emissions.

This report was generated using CarbonLite Pilot Demo v0.1 for emissions data readiness and workflow review purposes only. It is not a certified GHG emissions report and does not constitute regulatory compliance advice, third-party verification, audit assurance, or carbon credit eligibility determination. Emission factors, assumptions, and calculations should be reviewed by qualified sustainability professionals before formal use.

Top Emission Categories



Appendix A: Imported Record-Level Source Evidence

Detailed record-level source evidence retained for imported activity records in this report scope. The main report body summarizes this information by source file.

Appendix B: Source Rows Requiring Review

Source spreadsheet rows that remained unresolved after import review. These rows are not included in ActivityData or the GHG emissions total until corrected and imported.
