CarbonLite Technical Review Package

KACH CANADA LTD.

Report Information

Prepared for review as part of a pilot emissions data readiness and reporting workflow. This draft export is not approved, verified, certified, or

Reporting Boundary

Detailed source, version, confidence level, and assumptions are provided in the Factor Details / Assumptions section below.

Calculation Quality Summary

[illegible] GHG emissions total. No records require review for this report scope.

Threshold Reference

Methodology and Limitations

Calculation Traceability

[illegible] activities contributing the largest share of current estimated emissions. Hotspot analysis helps identify where the organization may want to focus first for factor validation, data quality improvement, and where estimates are [illegible] reduction planning.

Canada federal context: 10,000 t CO2e/year per facility is shown as a general screening reference only.
Alberta only: 100,000 t CO2e/year per facility is used only when a facility row has Alberta jurisdiction.
Threshold screening only. This does not constitute regulatory compliance advice.

Hotspot analysis only includes records that were successfully calculated. Records requiring review, tracked-only metrics, missing factors, invalid units, or missing jurisdiction are excluded from hotspot totals and listed separately.

Emissions are calculated from imported or manually entered activity data and configured emission factors. CarbonLite applies factor matching based on activity type, unit, jurisdiction, and reporting year.

Records without valid factors, units, quantities, dates, or required jurisdiction are excluded from emissions totals and listed as records requiring review. Tracked metrics are not included in calculated emissions totals.

Top Emissions Hotspot: Electricity

Electricity represents 89.64% of the current estimated emissions total. Because the underlying factor is a factor requiring review, validate the factor before using this hotspot for reduction planning.

Source documents, source references, and factor metadata should be reviewed before using report outputs for internal, consultant, or external reporting workflows.

Electricity and Business Travel - Accommodation together represent 100% of calculated emissions.

This report was generated using CarbonLite Pilot Demo v0.1 for emissions data readiness and workflow review purposes only. It is not a certified GHG emissions report and does not constitute regulatory compliance advice, third-party verification, audit assurance, or [illegible] eligibility determination. Emission factors, assumptions, and calculations should be reviewed by qualified sustainability professionals before formal use.

Top Emission Categories

Electricity		89.64%	519.40 kg CO2e
Business Travel - Accommodation		10.36%	60 kg CO2e

Appendix A: Imported Record-Level Source Evidence

Detailed record-level source evidence retained for imported activity records in this report scope. The main report body summarizes this information by sou

Appendix B: Source Rows Requiring Review

Source spreadsheet rows that remained unresolved after import review. These rows are not included in ActivityData or the GHG emissions total until corre
