CarbonLite Technical Review Package

KACH CANADA LTD.

Report Information

Prepared for review as part of a pilot emissions data readiness and reporting workflow. This draft export is not approved, verified, certified, or assured.

Reporting Boundary

Detailed source, version, confidence level, and assumptions are provided in the Factor Details / Assumptions section below.

Calculation Quality Summary

Review

GHG emissions total by design. Some additional records require review

Threshold Reference

Methodology and Limitations

Calculation Traceability

Canada federal context: 10,000 t CO2e/year per facility is shown as a general screening reference only.
Alberta only: 100,000 t CO2e/year per facility is used only when a facility row has Alberta jurisdiction.
Threshold screening only. This does not constitute regulatory compliance advice.

Hotspot analysis only includes records that were successfully calculated. Records requiring review, tracked-only metrics, missing factors, invalid units, or missing jurisdiction are excluded from hotspot totals and listed separately.

Emissions are calculated from imported or manually entered activity data and configured emission factors. CarbonLite applies factor matching based on activity type, unit, jurisdiction, and reporting year.

Records without valid factors, units, quantities, dates, or required jurisdiction are excluded from emissions totals and listed as records requiring review. Tracked metrics are not included in calculated emissions totals.

Top Emissions Hotspot: Electricity

Electricity contributes 71.70% of calculated emissions. Consider this category for reduction planning because it represents a large share of calculated emissions.

Source documents, source references, and factor metadata should be reviewed before using report outputs for internal, consultant, or external reporting workflows.

Electricity and Natural Gas together represent 92.15% of calculated emissions.

This report was generated using CarbonLite Pilot Demo v0.1 for emissions data readiness and workflow review purposes only. It is not a certified GHG emissions report and does not constitute regulatory compliance advice, third-party verification, audit assurance, or carbon credit eligibility determination. Emission factors, assumptions, and calculations should be reviewed by qualified sustainability professionals before formal use.

Top Emission Categories

Electricity		71.70%	6,625 kg CO2e
Natural Gas		20.45%	1,890 kg CO2e
Business Travel - Accommodation		7.85%	725 kg CO2e

Appendix A: Imported Record-Level Source Evidence

Detailed record-level source evidence retained for imported activity records in this report scope. The main report body summarizes this information by sou

Appendix B: Source Rows Requiring Review

Source spreadsheet rows that remained unresolved after import review. These rows are not included in ActivityData or the GHG emissions total until corre
