CarbonLite Technical Review Package

KACH CANADA LTD.

Report Information

Prepared for review as part of a pilot emissions data readiness and reporting workflow. This draft export is not approved, verified, certified, or assured.

Reporting Boundary

Detailed source, version, confidence level, and assumptions are provided in the Factor Details / Assumptions section below.

Requiring Review

Threshold Reference

Unreviewed source rows have not been promoted into ActivityData and are not counted as imported activity records requiring review.

Calculation Readiness and Limitations

Calculation methods, data quality, and reporting boundaries affect methods used to create the activity records included in this pilot report. Detailed regulatory threshold screening is not yet configured with reviewed source provenance for this jurisdiction.

Reviewed regulatory source provenance is required before threshold screening.

Threshold screening only. This does not constitute regulatory compliance advice.

Hotspot analysis helps identify where the organization may want to focus first for factor validation, data quality improvement, and where estimates are calculated less confidently.

Captured records flow through a workflow: Define Reporting Boundary; Collect & Upload Source Data; Review & Resolve Data Issues; Validate Factors & Calculations; Review Results; Generate & Review Report.

Hotspot analysis only includes records that were successfully calculated. Records requiring review, tracked-only metrics, missing factors, invalid units, or missing jurisdiction are excluded from hotspot totals and listed separately.

Emissions are calculated from imported or manually entered activity data and configured emission factors. CarbonLite applies factor matching based on activity type, unit, jurisdiction, and reporting year.

Records without valid factors, units, quantities, dates, or required jurisdiction are excluded from emissions totals and listed as records requiring review. Tracked metrics are not included in calculated emissions totals.

Top Emissions Hotspot: Natural Gas

Natural Gas represents 100% of the current estimated emissions total. Because the underlying factor is a factor requiring review, validate the factor before using this hotspot for reduction planning.

Source documents, source references, and factor metadata should be reviewed before using report outputs for internal, consultant, or external reporting workflows.

Top Emission Categories

This report was generated using CarbonLite Pilot Demo v0.1 for emissions data readiness and workflow review purposes only. It is not a certified GHG emissions report and does not constitute regulatory compliance advice, third-party verification, audit assurance, or carbon credit eligibility determination. Emission factors, assumptions, and calculations should be reviewed by qualified sustainability professionals before formal use.

Natural Gas	100%	1,890 kg CO2e

Appendix A: Imported Record-Level Source Evidence

Detailed record-level source evidence retained for imported activity records in this report scope. The main report body summarizes this information by source file.

Appendix B: Source Rows Requiring Review

Source spreadsheet rows that remained unresolved after import review. These rows are not included in ActivityData or the GHG emissions total until corrected and imported.
